# ANSWERS FOR ANY APPLICATION

ARTECHE latching relays are relays with 2 stable positions. Depending on which coil is energized, the output contacts will change from one position to another. The design of Arteche relay allows to have no consumption in permanence.

ARTECHE latching relays range is designed to guarantee the best features and optimal response even in the hardest working environment.

The design, durability and quality of the different alternatives that ARTECHE latching relays can offer (LDL range and standard range), make them suitable for high responsibility controls in different areas, highlighting:

## ELECTRICAL UTILITIES:

### Power plants, electrical substations.

- › Position monitoring of circuit breaker and sectionalizer
- › Direct operation on MV / HV (circuit breaker, sectionalizer)
- › Position memory:
  - manual / automatic
  - local / remote
- › Galvanic isolation between the control system and the primary equipment
- › Applications where high speed operation is a must
- › Applications where high breaking capacity is required
- › Tripping and lockout functions
- › Low duty loads control, activate digital inputs. LDL range

## INDUSTRIAL SECTOR:

### Continuous process industries (Petrochemical, concrete, iron industries), water treatment, ...

- › Critical process surveillance
- › Position monitoring circuit breaker and sectionalizer
- › Galvanic isolation between the control and the power systems
- › Low duty loads control, activate digital inputs. LDL range
- › Activation of security systems in industrial processes:
  - blocking electrical machines

The great power of the output contacts makes possible direct action on HV and MV switchgear, because their making/breaking capacities, continuous through-current and overvoltage capacity guarantee perfect insulation.

# GENERAL CHARACTERISTICS

The main features of ARTECHE's latching auxiliary relays are the followings:

- › Designed to allow continuous operation even in high temperature ambient, within the whole voltage range.
- › No consumption in steady states.
- › Self-cleaning contacts.
- › High level of electrical insulation between circuits.
- › Availability of extended voltage range (+25/-30%) for high security applications.
- › Capable to operate under low duty loads, activate digital inputs, and operate without any load. LDL Range.
- › High speed operation (up to 10 ms).
- › Capable to withstand vibrations and seismic conditions (EN 61373; IEEE 344; IEEE 323; IEEE C37.98 Standards).
- › Sturdy design.
- › Front state indication on the nameplate.
- › High protection degree (IP40), with transparent cover, making them suitable for use in salty and tropical atmospheres.
- › In compliance with the most demanding test standards: IEC, EN, IEEE and bearing the CE mark.
- › Wide range of auxiliary voltage levels (Vdc and Vac).
- › Versatile installation (plug-in relays in a wide range of sockets with different installation configurations).
- › Capable to work under environments with relative humidity around 100%.
- › No need of maintenance after installation.

Large variety of assemblies with frontal and rear connection sockets by screw or fast-on clip.

# TECHNICAL STANDARDS

## GENERAL STANDARDS

In addition to the specific applicable standards, ARTECHE latching relays are designed taking the following standards as reference:

- › **IEC 61810:** Electromechanical all-or-nothing relays.
- › **IEC 60255:** Electrical relays. Measuring relays and protection equipment.
- › **IEC 61812:** Specified time relays for industrial use.
- › **IEC 60947:** Low-voltage switchgear and controlgear.
- › **IEC 61000:** Electromagnetic compatibility.

E322124

**UL Recognized Component Marks for USA and Canada:** The combined UL signs for the USA and Canada are recognized by the authorities of both countries. All auxiliary relays identified with this mark meet the requirements of both countries.

# RANGE OF PRODUCTS

## General purpose latching relays

The ARTECHE latching relays have 2 steady positions. These positions are held by a permanent magnet, which prevents intermediate positions, giving a huge security operation. The position change is made with 2 sets of coils with separate entrances in BF3 and BJ8 and with breaking-flame contacts for each set of coils.

Their pick-up time lower than 20 ms and the high breaking capacity of their contacts make them appropriate to be used as an interface between the secondary equipment and the primary equipment. The main application for these relays is multiply the output contacts in those controls that need to memorize 2 stable positions:

- automatic / manual
- close / open

## Auxiliary trip and lockout relays

ARTECHE offers specific relays intended to be used in tripping and lockout applications, where high quality requirement in operating time (with models that assure the trip ever in less than 10 ms) and breaking capacity are needed.

Front indication on the nameplate, that indicates if the relay has changed the contact position.

All the relays include a diode in parallel with the coil (see bistable relays with overvoltage protection characteristic).

There is also the possibility of a bistable trip and lockout relay with manual reset.

## Latching relays with coil overvoltage protection

ARTECHE's auxiliary relays, either Vdc or Vac, have the possibility of including an element in parallel with the coil (diode or varistance).

These elements aim to prevent the over voltage peak generated by the coil itself and it may affect other equipment installed on the same line.

# TECHNICAL FEATURES PER MODEL

› World-class range of auxiliary relays for energy sector, specially designed for the most demanding applications

# GENERAL PURPOSE LATCHING RELAYS

# BREAKING CAPACITY

› With devices operating worldwide, also heavy industries like oil & gas sector trust in our relays.

# BREAKING CAPACITY

The breaking capacity is a critical parameter on the design and the applications of the relays. Its mechanical life could be considerably reduced, depending on the value of the load (especially with heavy duty loads), the number of operations and the environmental conditions in which the relay is operating.

In any configuration, ARTECHE's auxiliary relays have a high breaking capacity values. These limits are showed in the table below, in terms of power and current values. In all the cases, these relays guarantee a right performance during 50,000 operations.

Likewise, the values showed in the following charts have been obtained in standard conditions in the laboratory, and they could be different in real conditions. In any case, the possibility of connecting serial contacts or a bigger distance between contacts makes these values to be considerably increased.

## 24 Vdc voltage Different loads configurations.

Vdc	Contact configuration	0 ms		20 ms		40 ms	
		P(W)	I(A)	P(W)	I(A)	P(W)	I(A)
24	1 contact	500	20,83	370	15,42	250	10,42

(\*) Ask for data and curve of serial contacts

## 110 Vdc voltage Different loads configurations.

### Resistive load:

> L/R= 0 ms.

### Highly inductive load:

> L/R= 40 ms.

— 1 contact  
— 2 contacts

Vdc	Contact configuration	0 ms		20 ms		40 ms	
		P(W)	I(A)	P(W)	I(A)	P(W)	I(A)
110	1 contact	170	1,55	140	1,27	90	0,82
	2 contacts	1,360	12,36	1,106	10,05	730	6,63

## 220 Vdc voltage

Different loads configurations.

### Resistive load:

› L/R= 0 ms.

### Highly inductive load:

› L/R= 40 ms.

— 1 contact  
— 2 contacts

Vdc	Contact configuration	0 ms		20 ms		40 ms	
		P(W)	I(A)	P(W)	I(A)	P(W)	I(A)
220	1 contact	150	0,68	115	0,52	66	0,30
	2 contacts	319	1,45	234	1,06	134	0,61

## HOW TO SELECT THE CURVE OF MY RELAY

These charts show the breaking capacity values, either for resistive and highly inductive loads, in three voltage values of reference (ask for other voltage values). The charts show two different curves:

- › 1 contact: Breaking capacity of the relays with distance between contacts = 1.8 mm.
- › 2 contacts: Breaking capacity for relays with serial contacts, and distance between contacts=1.8 mm.

The distance between contacts is shown in the tables of technical data.

## HOW THE BREAKING CAPACITY CAN BE INCREASED

ARTECHE's auxiliary relays are power relays, designed specially to have a high breaking capacity. Thus, there are applications where the loads are so high that it is necessary to even increase the breaking capacity, keeping the reliability of the contacts of the auxiliary relays.

Thus, ARTECHE relays have the following alternatives and recommendations:

- › Possibility of external connection of equipment (serial contacts) getting an important increase of breaking capacity in these equipment is shown, guaranteeing the right performance during a high number of operations.

## LOW DUTY LOADS CAPABLE RELAYS (LDL)

There are some applications where the relay contacts establish circuits where the driven current is intrinsically low and are very dependent upon the voltage applied. In this kind of use, if the voltage applied to those kind of circuits differs (even slightly) from the one already specified, the circuit energisation fails. One of these cases is when we use relays to activate digital inputs. In these situations is necessary to minimise the contact resistance in the relay. To achieve that, while the relay is manufactured, its contacts are submitted to a special conditioning to make its contacts resistance extremely low.

# PICK-UP VOLTAGE/RELEASE VOLTAGE-TEMPERATURE CHARTS

Variability of operative voltage range against temperature for the latching auxiliary relays.

General purpose latching relays and relays with coil overvoltage protection.

## GENERAL PURPOSE RELAYS

### Operative range against ambient temperature.

## TRIP AND LOCKOUT RELAYS AND TRIP AND LOCKOUT RELAY WITH PUSH TO RESET BUTTON

### Operative range against ambient temperature.
